Unlike in the past, Lightroom 5 is no longer an upgrade tool for Lightroom shipped with Lightroom 4. It is based on the current stable Lightroom 5 release, although we knew the first releases containing the fifth major release would be dated March 17, 2016. This was the day when the beta version of Lightroom 5 was first released. From that day Lightroom 5 development has proceeded, but nothing more than bug fix releases from that date were shipped. It is possible however that future updates, to correct outstanding issues or to add features, could be a little more frequent. The changes being wrought to the main Lightroom 5 application, which is becoming more like a desktop application rather than a cross-platform application, are accentuated by a lot more than just added features. Some of them are private changes to ensure users stick to the design principles for an ideal editing workflow. However, some of the embedded features are directly related to the new features, and others may seem like a side-effect but are directly related to these new features. In all cases, I will discuss these features first, then outline how the new functionality relates to specific concepts such as Camera RAW, image editing, or sharing. Then, I will describe some of the other changes in Lightroom 5, both functional and non-functional changes (the latter being mostly visual changes related to the spread of the interface, the movement of components on the interface, or the change in colors and textures of the skin on some images).

The Levels tool lets you take control of how dark or light an image is. Selecting a white point or black point will make the image lighter or darker than it was before. Using the midtones roll over, the image can be modified so that the lighter areas are whiter and the darker areas are blacker. Designers build their design process out of modeling, refining, and testing. You can develop and test those design principles out in the design environment and then apply them to a new project. **Selection** The powerful Object Selection tool enables you to select and control objects like text, shapes, and layers more accurately, and in more ways than ever before. Even the path tools allow you to make precise selections and draw selections that are accurate down to a pixel. This the fastest way to select objects despite the size of the image and the complexity of the underlying image data. Line weight, highlights, and gradients are all available to control the appearance of these selections with layer blending modes and adjustment layers. Selections can be edited with the Object > Expand feature in the Layers panel, with Layer masks, and with the Contract and Quick Mask tools. Data extracted from a selection can be edited with the Magic Wand and the levels in the Levels panel. The Magnetic Lasso tool expands and contracts selections automatically for the best possible results. **Adjustment Layers and Adjustment** Adjustment layers create a secondary layer that is affected by the blending mode and opacity of the original layer. Adjustment layers offer the same benefits as traditional layer masks, but are perfect for many creative arts, graphic design, and photography needs. Adjustment layers can be used to track changes in the image to match a graphic design or to create stylish special effects that are truly “artist-friendly.” For example, you can use the Levels panel to track image exposure and color, and use adjustment layers to control the appearance of light and color throughout the photo. Adjustment layers are available on the image, the layer, and on the image mask.
